About this guide

This guide is one of a series aimed at practitioners from a wide range of providers, includir colleges, independent learning providers and those working in the Secure Estate, who sup post-16 vocational learners to develop their maths skills up to and including level 2.

The guides, together with Ims which aim to stimulate viewers to re ect on their practice, have been created as part of the Maths Pipeline Programme

As a vocational teacher you are able to provide a practical learning environment in which learners see a rea purpose for developing their maths skills, and you can demonstrate convincingly that strong maths skills underpin vocational professionalism. This guide suggests ways in which you can engage your learners' interest and support them to develop their maths skills.

Throughout the guide you will nd sections encouraging you to take a look at other websites, Im clips or educational research documents. These sections are identi ed using the icons shown below.

The guide is one of ve in a series from the Education and Training Foundation (ETF) Maths Pipeline Programme. There are four Guides aimed at vocational teachers working in

- 1. Construction and the Built Environment
- 2. Health and Social Care
- 3. Hospitality and Catering
- 4. Hairdressing and Beauty Therapy

Why should I be concerned about developing my learners' maths skills?

Here are four good reasons:

Developing your learners' maths skills can help them progress in their vocational course

When vocational and maths teachers work together, retention and achievement rates for maths and for the vocational subject improve. Setou Wouldn't Expect a Maths Teacher to Teach Plastering.....

Improving your learners' maths skills increases the employment opportunities open to them.

Maths skills are highly transferable, and improving them will help a learner to become more employable, regardless of whether they stay with their current vocational area.

Maths errors can be costly to any business

Think about the wider consequences if people make mathematical errors whilst working in their chosen area of employment or self-employment. Errors can waste time and resources, can lead to dissatis ed customers, and can undermine health and safety standards.We260e441 I -12 370e441me momse441me

Some teaching ideas

We've introduced a small number of teaching ideas in this section to illustrate approaches which relate maths to your vocational subject and which help learners to understand key mathematical ideas deeply.

Active learning is key; in particular, it can help learners to become aware of and resolve any mathematical misconceptions they may have. Active learning uses strategies such as group work, discussion and open questioning to encourage learners to become re ective, to think mathematically and make links between topics, instead of using memorised techniques or processes. This approach helps students to make connections between their ideas, to understand the interconnected nature of maths and confront common misconceptions and di culties.

Later sections (see page 9 onwards) describe and respond to some challenges you might face, expand or the principles and research underpinning these teaching approaches, and o er many more teaching ideas.

Picturing the maths in your vocational area

Start with a picture related to hair and beauty, one which your learners can relate to, and ask them to list some jobs/tasks that spring to mind. Then ask your learners to think about the maths they are likely to encounter when performing those tasks.

Here is one example used at a Vitaliser event, run as part of the Maths Pipeline Progrator thairdressing teachers. You could substitute a picture of towels, colouring solutions or beauty products, shampooing, rollers, a reception desk, an appointment book, etc.

Tasks/Jobs

Maths which underpins one of these tasks: Mixing hair dyes

This<u>interactive tool</u> lets you design your own salon. It can be used to cover areas such as scale drawing, practical design aspects, costing, etc. The tool could also support the work in this <u>booklet</u> from the Hwb Welsh key skills support program.

<u>VirtualSalon</u> is an interactive activity that shows some of the maths involved with running a hair and beauty salon.

Sometimes true, always true, never true

This kind of activity challenges learners to think deeply about a topic, and also requires them to articulate their thinking. As they are working on the activity, listen to the arguments they are creating, and encourage them to express themselves clearly verbally and on paper; this formative assessment aspect will help identify and resolve any misconceptions.

Find a space large enough for all the learners to line up facing you. Give each learner one of the cards. As the group to select one of the statistics from the cards, e.g. total population. Now ask the learners to line up in order of total population, from the smallest at one end to the largest at the other end. When they have done this, ask them to read out their population statistic. Get the whole group involved in checking that everyone is in the right place in the line.

Di cult topics

There may be speci c mathematical topics which, from experience, you know learners will nd di cult. Below are some suggestions of resources to support learners in some of these areas.

<u>Maths4life</u> is a series of booklets providing teaching materials for a variety of topics, including number, time and money, fractions, measurements. (You will need to register with NCET,9(()-4u up a free account.)

<u>Maths Everywhere</u> has some excellent short clips to help learners develop their maths skills. The site has three sections; some tools to help with everyday maths (e.g. currency conversion9(()planning journeys); a set of 'how to do' short clips;9(()-ome

Meeting the challenges

Working together with maths practitioners

Professor Malcolm Swan of Nottingham University, whose research underpinned both Improving Learning in Mathematics, and Thinking Through Mathematics, identi ed eight principles for e ective teaching of maths.

Teaching is more e ective when it ...

- t builds on existing knowledge
- t exposes and discusses misconceptions
- t uses higher-order questions
- t uses cooperative small group work
- t encourages reasoning not 'answer getting'
- t uses rich, collaborative tasks
- t creates connections between topics
- t uses technology in appropriate ways

Take a look at <u>Improving Learning in Mathematians</u>d <u>Thinking Through Mathematics</u> on the NCETM website for more information about these principles and how you can apply them in your own practice.

Initial, diagnostic and formative assessment

Your learners will learn most e ectively when you and they develop insights - through initial and formative assessment approaches - into their needs. Maths specialists often carry out initial and diagnostic assessments before learners join a course, and may be able to share the results with you. You can also us

How can I develop my own maths knowledge and skills?

In parallel with developing your teaching strategies, you may wish to develop your personal maths skills.

A quick internet search may yield a good Im clip or document which helps. Another approach might be to ask a friend or colleague, maybe someone from your maths department if you work in a college. Some clips of sta working together are shown in the Ims which link to this guide, and have been referenced earlier:
